

NAME:Pendem Harshitha

ID:2403A510C9

BATCH:05

SCHOOL OF COMPUTER SCIENCE AND ARTIFICIAL INTELLIGENCE		DEPARTMENT OF COMPUTER SCIENCE ENGINEERING	
Program Name: B.Tech		Assignment Type: Lab	
		Academic Year: 2025-2026	
Course Coordinator Name STUDENT DETAILS:		Venkataramana Veeramsetty. Pendem Harshitha Batch-05 2403a510c9	
Instructor(s) Name		Dr. V. Venkataramana (Co-Ordinator) Dr. T. Sampath Kumar Dr. Pramoda Patro Dr. Brij Kishor Tiwari Dr. J. Ravichander Dr. Mohammand Ali Shaik Dr. Anirodh Kumar Mr. S. Naresh Kumar Dr. RAJESH VELPULA Mr. Kundhan Kumar Ms. Ch. Rajitha Mr. M Prakash Mr. B. Raju Intern 1 (Dharmateja) Intern 2 (Sai Prasad) Intern 3 (Sowmya) NS_2 (Mounika)	
Course Code	24CS002PC215	Course Title	AI Assisted Coding
Year/Sem	II/I	Regulation	R24
Date and Day of Assignment	Week 1 - Monday	Time(s)	
Duration	2 Hours	Applicable to Batches	24CSBTB01 To 24CSBTB39
Assignment Number: 2.1 (Present assignment number) / 24 (Total number of assignments)			
Q.No.	Question	Expected Time to complete	
1	Lab 1: Environment Setup – GitHub Copilot and VS Code Integration Lab Objectives: • To install and configure GitHub Copilot in Visual Studio Code.	Week 1 - Monday	

To explore AI-assisted code generation using GitHub Copilot.

- To analyze the accuracy and effectiveness of Copilot's code suggestions.
- To understand prompt-based programming using comments and code context

Lab Outcomes (LOs):

After completing this lab, students will be able to:

- Set up GitHub Copilot in VS Code successfully.
- Use inline comments and context to generate code with Copilot.
- Evaluate AI-generated code for correctness and readability.
- Compare code suggestions based on different prompts and programming styles.

Task 0

- Install and configure GitHub Copilot in VS Code. Take screenshots of each step.

Expected Output

- Install and configure GitHub Copilot in VS Code. Take screenshots of each step.

Task 1: Factorial without Functions

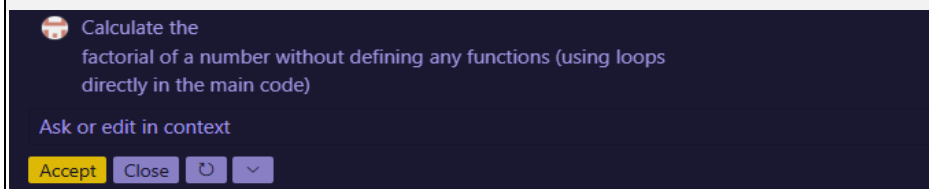

- Description:

Use GitHub Copilot to generate a Python program that calculates the factorial of a number without defining any functions (using loops directly in the main code).

- Expected Output:

- A working program that correctly calculates the factorial for user-provided input.
- Screenshots of the code generation process.

Prompt:

Code:

```
# Calculate factorial of a number using a loop (no function)

n = int(input("Enter a number: "))
fact = 1

for i in range(1, n + 1):
    fact *= i

print("Factorial of", n, "is", fact)
```

Output:

```
C:\Users\venub\OneDrive\Desktop\AIAC_Lab\Lab_1>python 1.1.py
Enter a number: 1
Factorial of 1 is 1
```

```
C:\Users\venub\OneDrive\Desktop\AIAC_Lab\Lab_1>python 1.1.py
Enter a number: 9
Factorial of 9 is 362880
```

Task 2: Improving Efficiency

- Description:

Examine the Copilot-generated code from Task 1 and demonstrate how its efficiency can be improved (e.g., removing unnecessary variables, optimizing loops).

- Expected Output:

- Original and improved versions of the code.
- Explanation of how the improvements enhance performance

prompt and code:

```
# Calculate factorial of a number using a loop (no functions)
# Task1
n = int(input("Enter a number: "))
fact = 1

for i in range(1, n + 1):
    fact *= i

print("Factorial of", n, "is", fact)

# Calculate factorial of a number efficiently using math.factorial
# Improved code(Task2)
import math

n = int(input("Enter a number: "))
fact = math.factorial(n)

print("Factorial of", n, "is", fact)
```

The loop-based factorial calculation is already quite efficient for small numbers. However, you can improve efficiency slightly by using the `math.factorial()` function, which is implemented in C and optimized for performance. If you must use a loop and no functions, you can improve efficiency by using local variables and avoiding unnecessary operations.

Task 3: Factorial with Functions

- Description:

Use GitHub Copilot to generate a Python program that calculates the factorial of a number using a user-defined function.

- Expected Output:

- Correctly working factorial function with sample outputs.
- Documentation of the steps Copilot followed to generate the function.

Prompt and code:

```
# Calculate factorial of a number using a user-defined function
```

```
def factorial(n):  
    fact = 1  
    for i in range(1, n + 1):  
        fact *= i  
    return fact  
  
n = int(input("Enter a number: "))  
fact = factorial(n)  
print("Factorial of", n, "is", fact)
```

```
C:\Users\venub\OneDrive\Desktop\AIAC_Lab\Lab_1>python 1_1.py  
Enter a number: 4  
Factorial of 4 is 24
```

Task 4: Comparative Analysis – With vs Without Functions

- Description:

Differentiate between the Copilot-generated factorial program with functions and without functions in terms of logic, reusability, and execution.

- Expected Output:

- A comparison table or short report explaining the differences

```
Differentiate between the Copilot-generated factorial program with functions and without functions in terms of logic,  
• Expected Output:  
○ A comparison table or short report explaining the differences
```

> Used 1 reference

Here's a comparison between a factorial program **with functions** (like your current code) and **without functions**:

Aspect	With Functions (<code>factorial(n)</code>)	Without Functions (all logic in main)
Logic	Logic is encapsulated in a function, making it clear and modular.	Logic is written directly in the main function, making it less organized.
Reusability	The function can be called multiple times with different inputs, reused in other programs.	Code cannot be reused easily; it is specific to the current program.
Execution	Function is defined once, called as needed; easier to debug and test.	All logic runs sequentially in the main function, which can be harder to follow.
Readability	Code is easier to read and maintain; function name describes its purpose.	Code can be harder to read due to a large block of logic in the main function.
Scalability	Easy to extend (e.g., add recursion, error handling).	Difficult to extend without restructuring the main function.

Summary:

Using functions improves modularity, reusability, and maintainability. Programs without functions are less organized and harder to maintain.

Task 5: Iterative vs Recursive Factorial

- Description:

Prompt GitHub Copilot to generate both iterative and recursive versions of the factorial function.

- Expected Output:

- Two correct implementations.
- A documented comparison of logic, performance, and execution flow between iterative and recursive approaches.

Prompt:

For the above factorial codes i want the both iterative and recursive versions of the factorial function.

Code:

```

# Calculate factorial of a number using user-defined function
def factorial_iterative(n):
    fact = 1
    for i in range(1, n + 1):
        fact *= i
    return fact

def factorial_recursive(n):
    if n == 0 or n == 1:
        return 1
    else:
        return n * factorial_recursive(n - 1)

n = int(input("Enter a number: "))

print("Iterative: Factorial of", n, "is", factorial_iterative(n))
print("Recursive: Factorial of", n, "is", factorial_recursive(n))

```

Output:

```

C:\Users\venub\OneDrive\Desktop\AIAC_Lab\Lab_1>python 1_1.py
Enter a number: 8
Iterative: Factorial of 8 is 40320
Recursive: Factorial of 8 is 40320

C:\Users\venub\OneDrive\Desktop\AIAC_Lab\Lab_1>python 1_1.py
Enter a number: 0
Iterative: Factorial of 0 is 1
Recursive: Factorial of 0 is 1

```

Submission Requirements

1. Generate code for each task with comments.
2. Screenshots of Copilot suggestions.
3. Comparative analysis reports (Task 4 and Task 5).
4. Sample inputs/outputs demonstrating correctness.

Note: Report should be submitted a word document for all tasks in a single document with prompts, comments & code explanation, and output and if required, screenshots

	Evaluation Criteria: Criteria Max Marks Successful Setup of Copilot 0.5 Comparative Analysis – With vs Without Functions 1 Iterative vs Recursive Factorial 1 Total 2.5 Marks
